Appendix III

Legume Seed Source Directory

June 1992

HOW TO USE THIS DIRECTORY

If you already know the Latin name of the legume you are interested in, go directly to Section II. The species are listed in alphabetical order. Next to each species is one or more four letter company codes. The company names which correspond to the codes are found in Section III, along with the address, phone number and other useful information. If you know only a common name for the legume, first look that name up in Section I to find its Latin name. Soybeans, common beans and peanuts are not included, nor are there exhaustive listings for common edible legumes and forages.

About the Soil-Improving Legume Database

The information contained in this directory is maintained on the Rodale Institute Soil-Improving Legume Database. The database is intended to facilitate the flow of information on legumes which may be used for soil improvement. The information in the database includes sources of legume germplasm, performance of different legumes under various environmental conditions and their effects on the soil, descriptions of cropping and garden systems which include legumes for soil improvement, and names of individuals and institutions with experience and/or information on legumes. When completed, the database will be made available through inquiries to Rodale Institute, and via fact sheets and other publications, such as this directory.
